Title: US-09-979-558A-1 Parfect score: 1526		
1 tttgatcatggctccagatt	acctgcggctggatcacctc 1526	
Scoring table: <pre>_QUIGO_NUC3</pre> Gapop 60.0 , Gapext 60.0		
Searched: 4390206 segs, 2959870667 residues		
Word size : 0	4	
Total number of hits satisfying chosen parameters: 87	8780412	
Minimum DB seq length: 0 Maximum DB seq length: 200000000		

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

originally isolated from the Japan Trench. The invention also relates to a novel method for detecting or specifically identifying Psychrobacter pacificensis, Psychrobacter glacincola, and related species, or Psychrobacter pacificensis only via the use of the 165 rDNA sequence. The 165 rDNA sequence and derived oligonucleotide probe are useful for the species-specific detection of Psychrobacter pacificensis to study and monitor its growth as an indicator of the circulation of deep-sea water. The method of the invention is rapid, accurate and has high sensitivity, and removes the need to separate and culture the biological materials. The present sequence represents the Psychrobacter pacificensis 165 rDNA

The invention also relates to the encoded proteins. The invention additionally encompasses expression constructs, recombinant viruses and recombinant cells comprising the nucleic acids of the invention, recombinant production of the proteins, antibodies against the proteins, a method of identifying inhibitors of the proteins, and compositions comprising the inhibitors for administration to an animal. The nucleic acids, and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases
AAF28554). The library has a number of uses described in the specification e.g. is useful for aidentifying diagnostic and therapeutic compositions. M. catarrhalis (Branhamella catarrhalis) is a large aerobic, gram-negative diplococcus, normally found among the bacterial flora of human upper airways. M. catarrhalis is known to cause acute, localised infections such as otitis media, sinusitis and bronchopulmonary infection and life-threatening, systemic diseases including endocarditis
                                                                                                                                                                                                                                                                                                                                                                            92136 TAACGCAATAAGTAGACCGCCTGGGGAGTAACGCCGCAAGGTTAAAACTCAAATGAATTG

associated with flea infestations. For example, the nucleic acids may be used to produce an HMT or HNC protein according to standard recombinant by machodology by inserting the nucleic acids into a host cell and culturing the cell to express the protein. The HMT and HMC nucleic acids may also be used as DNA probes in diagnostic assays (e.g., PCR) to detect and quantitate the presence of cat flea or other homologous nucleic acid sequences in samples. They may also be used to study the expression and function of the proteins and their role in metabolism. The HMT and HNC proteins may be used as antigens in the production of specific antiabodies, and in assays to identify modulators (agonists and antagonists) of HMT and/or HNC protein expression and activity. The anti-HMT/HNC protein antibodies and antagonists may also be used to downregulate protein expression and activity. The antibodies are diagnostic agents for detecting the presence of flea polypeptides in samples (e.g., by enzyme linked immunosorbent assay (ELISA)). The present sequence represents a cat flea HNC cDNA of the invention
                                                                                                                                                                                                                                                                                                                                                                           ö

```

AAS11021-AAS11034 represent the coding sequences of bacterial 16s

```
ribosomal RNA (rRNA) genes. The sequences were used to design antibacterial compounds comprising substantially uncharged antisense oligomers containing 8 40 nucleotide subunits, including a trargeting nucleic acid sequence at least 10 nucleotides in length which is complementary to a bacterial 16S or 23S rRNA nucleic acid sequence. The antisense oligomers are used for treating a bacterial infection in a human or a mammalian animal produced by Escherichia coli, Salmonella typhimurium, Pseudomonas aeruginosa, Vibrio cholera, Neisseria cyphimurium, Pseudomonas aeruginosa, Vibrio cholera, Neisseria conorrhoea, Helicobacter pylori, Bartonella hanselae, Haemophilus influenza, Shigella dysenterae, Staphylococcus aureus, Mycobacterium tuberculosis, Streptococcus pneumoniae, Treponema palladium and Chlamydia trachomatis. The antibacterial compound may be used as a food grain sequence is not shown in the specification but has been accessed from GenBank using the appropriate accession number given in the
                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                            925
                                                                                                                                                                                                                                                                                                                                                                                                                                                               985
                                                                                                                                                                                                                                                                                                                                                                                                                             916

template DNA in the sample using a real-time polymerase chain reaction (FT PCR), where the PCR or PCR reaction mixture comprises primers and at least two fluorogenic probes. The methods are useful in detecting and determining species source of eubacterial DNA in a sample. The present method allows for highly sensitive detection of any eubacterial species with simultaneous speciation. It eliminates false positive results in detecting bacterial infections. This sequence represents a bacterial los RNA gene used to create the primers of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   source of eubacterial DNA in a sample. The method comprises amplifying template DNA in the sample using a real-time polymerase chain reaction (R T PCR), where the PCR or PCR reaction mixture comprises primers and at least two fluorogenic probes. The methods are useful in detecting and determining species source of eubacterial DNA in a sample. The present method allows for highly sensitive detection of any eubacterial species with simultaneous speciation. It eliminates false positive results in detecting bacterial infections. This sequence represents a bacterial 16s

Specifically, it refers to a water soluble polysaccharide producing microbe identified as Enterobacter ap. C-1 (FERM P-18947). The present invention describes the water soluble polysaccharide as comprising fucose, galactose, glucose and glucuronic acid, and collection of the same involves altering the pH value of the microbial culture solution to pH 4 by adding long-chain quaternary ammonium salt in order to isolate the ammonium salt
                                                                                                  GACCGCCTGGGGGAGTACGGCCGCAAGGTTAAAACTCAAATGAATTGACGGGGCCCCGCAC 925
                                                                                                                                   GACCGCCTGGGGGGTACGGCCGCAAGGTTAAAACTCAAATGAATTGACGGGGGCCCGCAC 916
                                                                                                                                                                         985
                                                                                                                                                                                           precipitate of the polysaccharide. Accordingly, this microorganism is useful for producing water-soluble polysaccharides that in turn can be used to produce the anti-cancer substance 4,5-dihydroxy 2-cyclopentene-1-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel microorganism having 16S rRNA gene, useful for producing water-soluble polysaccharide which produces anti-cancer substance on heating for long time.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     one (DHCP). Furthermore, the water-soluble polysaccharide compositions are useful in food and paper diaper products. This polynucleotide

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention relates to a novel method for isolating, depleting or separating a targeted nucleic acid, such as rRNA, from a sample comprising targeted and non-targeted nucleic acids. It effects a way of enriching for non-targeted nucleic acids such as mRNAs. Isolating sufficient quantities of high quality bacterial mRNAs is a demanding prosesse which impedes analysis of bacterial mRNAs is a demanding presence of host cells. A small percentage of bacterial mRNAs may be poly a tailed, but these are targeted for degradation and tend to be unstable. As a result, the commonly employed method for mRNA purification with eukaryotic cells, oligo-dr capture, is ineffective. The present invention provides an alternative, more suitable method for mRNA continued from prokaryotes. The method of the invention comprises the incubation of a sample with a bridging oligonucleotide (containing a targeting region) and subsequently incubating with a capture containing a targeting region and subsequently incubating with a capture containing method is useful for depleting or isolating targeted from the sample. The method is useful for depleting or isolating targeted nucleic acid, for example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S

The nucleic acid substrate is preferably an oligonucleotide containing a human p53 gene sequence or alternatively, microbial gene sequences. Cleavage products are compared to the cleavage products of reference gene sequences. The method is used for detecting mutation in the human p53 gene; for identifying strains of microorganisms, especially bacteria selected from the the group of members of the genera Campylobacter. Escherichia, Mycobacterium, Salmonella, Shigella and Staphylococcus. The method may also be used for the identification of viruses, especially chepticis. Virus (RTV) and simian immunodeficiency virus (SIV). Seven primers (AAT29131-39) were used to amplify 165 rRNA genes. The amplified genes were then subjected to the cleavage method and the resulting from fragmentation patterns used in identification of the microorganisms from

The specification describes 16S rDNA sequences, derived from various strains of Dehalococcoides ethenogenes. These 16S rDNA profile is linked to dechlorinating activity. Bacterial strain comprising the 16S rDNA sequence of the invention are useful for the dechlorination of chlorinated compounds such as carboncetrachloride, tetrachloroethane, chlorinated compounds the profile is a such as carboncethane, dichloromethane, trichloroethane, dichloromethane, trichloroethane, dichloroethane, trichloroethane, dichloroethane, trichloroethane, dichloroethane, chlorinating bacteria, as well as sub-typing identification of new chlorinating bacteria, as well as sub-typing

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                               US-09-979-558A-1

Sequence 13, Application US/07923871C

Patent No. 2912117

GENERAL INFORMATION:

APPLICANT: White Ph.D, Thomas J.

APPLICANT: Dodge, Deborah B.

TITLE OF INVENTION: Method for Diagnosis of Lyme Disease

NUMBER OF SEQUENCES: 38

CORRESPONDENCE ADDRESS:

ADDRESSEE: Hoffmann-La Roche Inc.
SOFTWARE: PatentIn Release #1.0, Version #1.25
CURRENT APPLICATION DATA:
APPLICATION NUMBER: PCT/US91/01574
FILING DATE: 19910307
CLASSIPICATION BATA:

Sequence 33, Application US/0954899BE
Patent No. 6797817
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: ELT. DUDONT DE NEMOURS & COMPANY, INC.
APPLICANT: BERROLE, RICHARD C.
APPLICANT: HENDRICKSON, EDWIN
TITLE OF INVENTION: UNCLEIC ACID FRAGMENTS FOR THE IDENTIFICATION OF DECHLORINATING R.
TITLE REFERENCE: BC1002 US NA
CURRENT APPLICATION NUMBER: US/09/548,998E
CURRENT FILING DATE: 1999-04-14
PRIOR PILING DATE: 1999-04-15
NUMBER OF SEQ ID NOS: 60
SOFTWARE: Patent In version 3.1
SEQ ID NO 33.1
LENGTH: 1542
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      937

Gamma-irradiated samples were harvested at 6, 12, 24 and 48 hours after treatment. UV-irradiated samples were harvested 24 hours post-treatment. CDNA was prepared from polyA+ enriched, pooled samples of equivalent amounts of total RNA from each sample. The CDNA was directionally ligated into the Uni-2ap XR vector (Stratagene) and packaged using the digapack III Gold packaging extracts. Phagemids containing cDNA inserts were in vivo excised from the recombinant Uni-ZAP XR vector using ExAssist helper phage and the E. coli strain XII-Blue MRF' (Stratagene). Excised plasmids were plated using SOLR
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Torres-Jerez, I to 609)
